Non-steroidal anti-inflammatory drugs (NSAIDs) are often used in the treatment of rheumatic and arthritic diseases. NSAIDs can cause side effects, of which rheumatic pain is the most common. Although the mechanisms involved in rheumatic pain are not yet fully understood, it is generally agreed that they are drug-induced, and they may be exerted by inhibiting cyclooxygenase enzymes. Drug-induced pain is based on the capacity of NSAIDs to activate transient receptors in the free nerve endings. However, as coxarthrosis is a progressive disease, mainly caused by cartilage degradation and bone involvement, other factors have been suggested to be involved. In this review, we have summarized some of the current ideas on the role of pain, inflammation, apoptosis and neurotransmitters, specifically the nociceptive ones, in coxarthrosis and consider the need for new diagnostic and therapeutic strategies. Characterization of radiation-induced crypt cell injury in mouse colonic crypts. Radiotherapy has had a crucial role in the management of malignancy as well as several nonmalignant conditions. The normal tissues of the gastrointestinal tract, specifically the intestinal crypts, are particularly sensitive to radiation injury. However, their repair 9df0af710a
